1 General Description

The “TCC” object (*TypChatoc* class) implements the base features and hosts the base data used to draw a “Time Current Characteristic”(TCC). A TCC is any line that can be drawn in a diagram having the current values plotted along the X-axis and the time values plotted along the y-axis (VisOplot object). The “TCC” object is used by the *TypToc* class.

Figure 1.1: Time-Current diagram (a VisOPlot object) with an extremely inverse TCC

The “TCC” object is defined by:

- The characteristic *Usage* (Time Overcurrent, Fuse, Damage Curve, Min Trip/Max Clear Time Overcurrent).
- The characteristic *Time dial* range. The *Plot curves* button allows drawing the TCCs accordingly with the inserted *Time dial* range. The *Time dial* control is not available when the *Fuse* or the *Damage Usage* is set. This range is used to define the *Time dial* setting in the *Time overcurrent* dialogue (*RelToc* class).
- The characteristic *Reset delay* range. This range is used to define the *Reset delay* setting (*ResetT* variable) in the *Time overcurrent* dialogue (*RelToc* class). The *ResetT* variable can be used in a DSL expression to define the reset characteristic of an inverse element.
- The characteristic graphical limits; the dialogue allows defining:
 - A *User Defined Min. Time* range which is used to define the *Min. Time* setting in the *Time overcurrent* dialogue (*RelToc* class). This setting value is the smaller time which can be reached by the TCC.
 - A *User Defined Max. Time* range which is used to define the *Max. Time* setting in the *Time overcurrent* dialogue (*RelToc* class). This setting value is the bigger time which can be reached by the TCC.

- A *Min Current* (in terms of trip threshold I_p). It is not available when the *Linear approximation* or the *Hermite polynom Function* is set.
 - A *Max. Current* (in terms of trip threshold I_p). It is not available when the *Linear approximation* or the *Hermite polynom Function* is set.
 - A *Min Tripping Time* (in seconds). If the characteristic calculated time value is smaller than the *minimum tripping time* the time value used to represent the characteristic is set equal to the *minimum tripping time*.
- the type of function used to describe the characteristic (Definite time , IEC 255-3 equation, ANSI/IEEE, Linear approximation etc, Hermite Polynom)
 - The data defining the characteristic:
 - The time current points if the *linear approximation* or the *Hermite Polynom* function is selected(i_type variable).
 - The equation parameter values if the *Definite time, IEC 255-3, ANSI/IEEE, ANSI/IEEE squared, ABB/Westinghouse, Special equation , I sqrt T(based on Ir) , I sqrt T(based on In), I sqrt T(based on Ip)* function is selected.
 - The user defined DSL equation string if *DSL -Equation* function is selected (i_type variable).
 - The ability to define if the characteristic is including a vertical line in the initial part (i_drawt variable).
 - When the *linear approximation* or the *Hermite Polynom* function is selected(i_type variable) two additional dialogue controls are displayed:
 - The *No. Of curves* edit box specifies how many curves we are defining and how many columns are available in the data matrix
 - The *Use Same x-Value* specifies if the time current points defining more than one TCC are sharing the same current

I-t Characteristic - Library\RE3 603\TCCs\Very Inverse.TypChatoc

Name: OK Cancel

Usage:

Time Dial
Range: Plot Curves

Reset Delay
Range: s

Limits
Min. Current: I/Ip Max. Current: I/Ip
Min. Tripping Time: s

User Defined
Min. Time: Max. Time:

Function: $T = T_p \cdot a_1 / (|I/I_p|^a_2 \cdot a_3)$

☐ Draw Start Time Offset

Values:

	1
a1	13.5
a2	1.
a3	1.

Figure 1.2: The *TypChatoc* dialogue when the *IEC 255-3* Function is selected

2 Available “Function” types

The “Function” combo box allows selecting how the *TypChatoc* object is modelling the TCC. 12 items are available:

1. Definite time
2. IEC 255-3
3. ANSI/IEEE
4. ANSI/IEEE squared
5. ABB/Westinghouse
6. linear approximation
7. Hermite Polynom
8. DSL- equation
9. Special equation
10. I sqrt T(based on Ir)
11. I sqrt T(based on In)
12. I sqrt T(based on Ip)

2.1 Definite time

I-t Characteristic - Library\REJ 603\TCCs\Definite Time.TypChatoc

Name: Definite Time

Usage: Time Overcurrent

Time Dial Range: 0.05, 0.07, 0.1, 0.15, 0.2, 0.25, 0.3, 0.4, 0.6, 0.8, 1, 1.4, 1.8, 2.2, 2.6

Reset Delay Range: s

Limits: Min. Current: 1, Max. Current: 20, Min. Tripping Time: 0.02 s

User Defined: Min. Time: 0.01-1, Max. Time: 1-100

Function: Definite Time, $T = T_p \cdot a_1$

☒ Draw Start Time Offset

Values:

a1	1
----	---

It defines a time constant TCC

Equation: $T = T_p \times a_1$

Where:

T = characteristic time value

I = characteristic current value

T_p = *Time dial* in the relevant RelToc dialog

a_1 = the value inserted in the first row first column of the *Values* matrix

2.2 IEC 255-3

I-t Characteristic - Library\REJ 603\TCCs\Normal Inverse.TypChatoc

Name:

Usage:

Time Dial:
Range:

Reset Delay:
Range:

Limits:
Min. Current: I/p Max. Current: I/p
Min. Tripping Time: s

User Defined:
Min. Time: Max. Time:

Function: $T = T_p \times a1 / ((I/I_p)^{a2} - a3)$

☐ Draw Start Time Offset

Values:

	1
a1	0.14
a2	0.02
a3	1.

It defines a TCC accordingly with the IEC 255-3 standard

$$\text{Equation: } T = T_p \times a1 / ((I/I_p)^{a2} - a3)$$

Where:

T = characteristic time value

I = characteristic current value

I_p = characteristic trip threshold

T_p = *Time dial* in the relevant RelToc dialog

a1 = the value inserted in the first row first column of the *Values* matrix

a2 = the value inserted in the 2nd row first column of the *Values* matrix

a3 = the value inserted in the 3rd row first column of the *Values* matrix

2.3 ANSI/IEEE

I-t Characteristic - ...Relay_Tripping Curves\ANSI Moderately Inverse.TypChatoc

Name:

Usage:

Time Dial:
Range:

Reset Delay:
Range:

Limits:
Min. Current: I/p Max. Current: I/p
Min. Tripping Time: s

User Defined:
Min. Time: Max. Time:

Function: $T = T_p \times (a1 / ((I/I_p)^{a2} - a3) + a4)$

☐ Draw Start Time Offset

Values:

	1
a1	0.0103
a2	0.02
a3	1.
a4	0.0228

It defines an equation accordingly with the US standards. This equation is an "extension" of the IEC equation. Equation:

$$T = T_p \times (a1 / ((I/I_p)^{a2} - a3) + a4)$$

Where:

T = characteristic time value

I = characteristic current value

I_p = characteristic trip threshold

T_p = *Time dial* in the relevant RelToc dialog

a1 = the value inserted in the first row first column of the *Values* matrix

a2 = the value inserted in the 2nd row first column of the *Values* matrix

a3 = the value inserted in the 3rd row first column of the *Values* matrix

a4 = the value inserted in the 4th row first column of the *Values* matrix

2.4 ANSI/IEEE squared

I-t Characteristic - ...y Library\ABB\SPAJ 160C\SPAJ 160C\ANSI-curve.TypChatoc

Name: ANSI-curve

Usage: Time Overcurrent

Time Dial: Range: 0.2-2

Reset Delay: Range:

Limits: Min. Tripping Time: 0.093 s

User Defined: Min. Time: 0 Max. Time: oo

Function: Hermite Polynomial No. of Curves: 3

☒ Use Same x-Values ☐ Draw Start Time Offset

Values:

	X	Y1	Y2	Y3
▶Tp	0	0.2	1	2
1	1.1	4464.895	22324.47	44648.95
2	1.111077	2169.555	10847.78	21695.55
3	1.117555	1312.949	6564.745	13129.49
4	1.132006	684.4774	3422.387	6844.774
5	1.147952	369.3553	1846.776	3693.553
6	1.159912	217.7774	1088.887	2177.774

$$\text{Equation: } T = (T_p \times a1 + a2) / (I / I_p)^2$$

Where:

T = characteristic time value

I = characteristic current value

I_p = characteristic trip threshold

T_p = Time dial in the relevant RelToc dialog

a1 = the value inserted in the first row first column of the Values matrix

a2 = the value inserted in the 2nd row first column of the Values matrix

2.5 ABB/Westinghouse

I-t Characteristic - ...cteristics (not used)\MCO-7 (Moderately inverse).TypChatoc

Name: MCO-7 (Moderately inverse)

Usage: Time Overcurrent

Time Dial: Range: 1-63

Reset Delay: Range:

Limits: Min. Current: 1.1 I/p Max. Current: 20 I/p Min. Tripping Time: 0.002 s

User Defined: Min. Time: 0.001 Max. Time: oo

Function: ABB/Westinghouse

☐ Draw Start Time Offset

Values:

	1
▶a1	524.84
a2	3120.56
a3	0.8
a4	1
a5	2491

Equation:

$$I / I_p < 1.5$$

$$T = a5 \times T_p / (24000 \times (I / I_p - 1))$$

$$I / I_p > 1.5$$

$$T = (a1 + a2 / ((I / I_p) - a3)^{a4}) \times T_p / 24000$$

Where:

T = characteristic time value

I = characteristic current value

I_p = characteristic trip threshold T_p = Time dial in the relevant RelToc dialog

a1 = the value inserted in the first row first column of the Values matrix

a2 = the value inserted in the 2nd row first column of the Values matrix

a3 = the value inserted in the 3rd row first column of the Values matrix

a4 = the value inserted in the 4th row first column of the Values matrix

a5 = the value inserted in the 5th row first column of the Values matrix

2.6 Linear approximation

I-t Characteristic - ...Characteristics\IAC Long Time Inverse GES7004B.TypChatoc

Name: IAC Long Time Inverse GES7004B

Usage: Time Overcurrent

Time Dial: Range: 0.5;1;2;3;4;5;6;7;8;9;10

Reset Delay: Range: s

Limits: Min. Tripping Time: 0.45 s

User Defined: Min. Time: 0.001 Max. Time: oo

Function: Linear approximation No. of Curves: 11

☒ Use Same x-Values ☐ Draw Start Time Offset

Values:

	X	Y1	Y2	Y3	Y4	Y5	Y6	Y7
Time	0.5	0.5	1.	2.	3.	4.	5.	6.
1	1.5	6.4	13.	27.5	45.	64.	80.	95.
2	2.	3.736	7.597	16.65	24.77	36.61	45.87	55.19
3	3.	2.48	4.979	10.38	16.16	22.25	28.13	35.43
4	4.	1.998	3.919	8.067	12.95	17.24	21.92	28.2
5	5.	1.71	3.307	6.75	11.	14.5	18.5	24.
6	6.	1.483	2.898	5.871	9.612	12.71	16.26	21.14

The characteristic is defined by points using a linear approximation between the sets of input points.

The number present in the *No. of Curves* represents how many set of points are defined. In the picture on the right there are 3 set of points defined for "0.2", "1" and "2" time dial (the time dials are listed in the first row 2nd, 3rd and 4th column). In the 1st column the current values are listed. The 1st column, 1st row cell contains a dummy value (0 in the picture). To draw for instance the characteristic for time dial equal = 0.5 the time dial = 0.2 and the time dial = 1 point sets will be interpolated. Please notice that the *Use Same x-Values* check box is on and so the matrix first column contain a set of current values which is common to all the time value sets present in the "Y1", "Y2" and "Y3" column.

2.7 Hermite Polynom

I-t Characteristic - ...y Library\ABB\SPA1 160C\SPA1 160C\ANSI-curve.TypChatoc

Name: ANSI-curve

Usage: Time Overcurrent

Time Dial: Range: 0.2;2

Reset Delay: Range: s

Limits: Min. Tripping Time: 0.093 s

User Defined: Min. Time: 0 Max. Time: oo

Function: Hermite Polynom No. of Curves: 3

☒ Use Same x-Values ☐ Draw Start Time Offset

Values:

	X	Y1	Y2	Y3
Time	0.	0.2	1.	2.
1	1.1	4464.895	22324.47	44648.95
2	1.111077	2169.555	10847.78	21695.55
3	1.117555	1312.949	6564.745	13129.49
4	1.132006	684.4774	3422.387	6844.774
5	1.147952	369.3553	1846.776	3693.553
6	1.159912	217.7774	1088.887	2177.774

The characteristic is defined by points using a hermite approximation between the sets of input points.

The number present in the *No. of Curves* represents how many set of points are defined. In the picture on the right there are 3 set of points defined for "0.2", "1" and "2" time dial (the time dials are listed in the first row 2nd, 3rd and 4th column). In the 1st, 3rd and 5th column the current values are listed.

The 1st column, the 3rd and 5th row cells contain a dummy value (0 in the picture). To draw for instance the characteristic for time dial equal = 0.5 the time dial = 0.2 and the time dial = 1 point sets will be interpolated in a linear way. Please notice that the *Use Same x-Values* check box is off and so there is a column containing a set of current values for each column containing a set of time valued.

2.8 DSL equation

Equation: any valid DSL equation

Please notice that the equation must not include T or I (Ip represents already I/Ip)

Equation example:

$$1 \times Tp / (0.339 - (0.236 / Ip))$$

Where the allowed variable names are:

Ip = *Current threshold* in the RelToc dialogue (*Ipset* variable)

Tp = *Time dial* in the RelToc dialogue (*Tpset* variable)

Ip_{re} = *Pre-fault current/Ip* (for the thermal image)

Tshift = *time shift* in the RelToc dialogue (*Tshift* variable)

Minresp = *Min.response time* in the RelToc dialogue (*minresptime* variable)

Tadd = *Time adder* in the RelToc dialogue (*Tadder* variable)

ResetT = *Reset delay* in the RelToc dialogue (*ResetT* variable)

Udeftmin = *Min. Time* in the RelToc dialogue (*udeftmin* variable)

Udeftmax = *Max. Time* in the RelToc dialogue (*udeftmax* variable)

Please note that the *Time adder* and the *Min.response time* settings usually should not be inserted inside the DSL equation; indeed they are already automatically applied to the time value provided by the DSL equation calculation.

2.8.1 Thermal Image

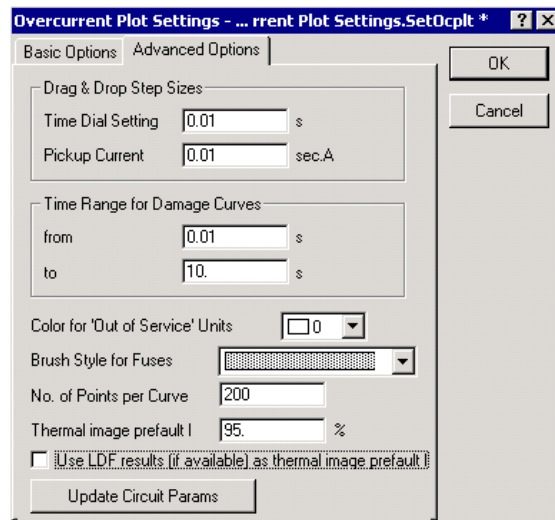

The thermal image can be modelled using a DSL equation where the "Ip_{re}" variable represents the current flowing before the fault. The thermal image will be represented using two characteristics:

The *upper* characteristic is drawn assuming a null value of the pre-fault current.

The *lower* characteristic is drawn using a default current value or the pre-fault current calculated by the LDF. When a short circuit calculation is run the trip time is calculated using such characteristic.

The thermal image representation can be “controlled” using the SetOcPlot dialogue.

In the *Advanced options* tab page you can find the *Thermal image pre-fault I %* which allows setting a default value for the pre-fault current value which is used to draw the *lower* thermal image characteristic. The *upper* characteristic is always drawn assuming a null value of the pre-fault current.

The *use LDF results(if available)as thermal image pre-fault I* check box allows setting which kind of value must be used to draw the thermal image characteristic.

If it is checked and the LDF has been run the “lower” thermal image characteristic is drawn using the LDF current as pre-fault current. If it is not checked or if the LDF hasn’t been run yet the *Thermal image pre-fault I %* value is used as pre-fault current value.

2.9 Special equation

The dialog box 'I-t Characteristic - ...brary\Schweitzer\SEL 351\TCCs\Special equation.TypChatoc *' contains the following fields and controls:

- Name:** Special equation
- Usage:** Time Overcurrent
- Time Dial:** Range [0.5-15;0.01], Plot Curves button
- Reset Delay:** Range [], unit [s]
- Limits:**
 - Min. Current: 1.5 I/p, Max. Current: 30 I/p
 - Min. Tripping Time: 0.05 s
- User Defined:** Min. Time: 0, Max. Time: oo
- Function:** Special Equation, Formula: $T = Tp \times a1 / ((I/Ip + b1)^{b2} + b3) + Tp \times a2 + a3$
- Draw Start Time Offset:** unchecked
- Values:**

	1
a1	1.
a2	2.
a3	4.16
b1	1.
b2	2.
b3	1.

Equation:

$$T = Tp \times a1 / ((I/Ip + b1)^{b2} + b3) + Tp \times a2 + a3$$

Where:

T = characteristic time value

I = characteristic current value

Ip = characteristic trip threshold

Tp = *Time dial* in the relevant RelToc dialog

a1 = the value inserted in the first row first column of the *Values* matrix

a2 = the value inserted in the 2nd row first column of the *Values* matrix

a3 = the value inserted in the 3rd row first column of the *Values* matrix

b1 = the value inserted in the 4th row first column of the *Values* matrix

b2 = the value inserted in the 5th row first column of the *Values* matrix

b3 = the value inserted in the 6th row first column of the *Values* matrix

2.10 I sqrt T(based on Ir) I sqrt T(based on In)

The dialog box 'I-t Characteristic - ...st\Relay Library\Schweitzer\SEL 351\TCCs\I2t Ir.TypChatoc *' contains the following fields and controls:

- Name:** I2t Ir
- Usage:** Time Overcurrent
- Time Dial:** Range [0.5-15;0.01], Plot Curves button
- Reset Delay:** Range [], unit [s]
- Limits:**
 - Min. Current: 1.5 I/p, Max. Current: 30 I/p
 - Min. Tripping Time: 0.05 s
- User Defined:** Min. Time: 0, Max. Time: oo
- Function:** I sqrt T (based on Ir), No. of Curves: 2
- Draw Start Time Offset:** unchecked
- Values:**

	Ir/Offset	Y1
Ir/Tp=	80	1.
T=	2.	3.

Equation:

$$T = (TS + a3) \times a1^2 / (I^2)$$

Where:

$$TS = Tp \times a2$$

T = characteristic time value

I = characteristic current value

Ip = characteristic trip threshold in pu

Tp = *Time dial* in the relevant RelToc dialog

a1 = the value inserted in the first row first column of the *Values* matrix (80 in the picture)

a2 = the value inserted in the 2nd row 2nd column of the *Values* matrix (3 in the picture)

a3 = the value inserted in the 2nd row 1st column of the *Values* matrix (2 in the picture)

2.11 I sqrt T(based on Ip)

I-t Characteristic - ...st\Relay Library\Schweitzer\SEL 351\TCCs\I2t Ir.TypChatoc *

Name: I2t Ir

Usage: Time Overcurrent

Time Dial: Range: 0.5-15, 0.01

Plot Curves

Reset Delay: Range:

Limits: Min. Current: 1.5 I/p Max. Current: 30 I/p Min. Tripping Time: 0.05 s

User Defined: Min. Time: 0 Max. Time: oo

Function: I sqrt T (based on Ir) No. of Curves: 2

☐ Draw Start Time Offset

Values:

	Ir/T offset	Y1
► Ir/Tp=	80	1.
T=	2.	3.

Equation:

$$T = \max((TS + a3), a1^2 / Ip^2)$$

Where:

$$TS = Tp \times a2$$

T = characteristic time value

I = characteristic current value

Ip = characteristic trip threshold in pu

Tp = *Time dial* in the relevant RelToc dialog

a1 = the value inserted in the first row first column of the *Values* matrix(80 in the picture)

a2 = the value inserted in the 2nd row 2nd column of the *Values* matrix(3 in the picture)

a3 = the value inserted in the 2nd row 1st column of the *Values* matrix(2 in the picture)

3 Available “Usage”

The *Usage* combo box allows selecting which kind of TCC the object is modelling. 4 items are available:

1. Time Overcurrent
2. Fuse
3. Damage Curve
4. Min Trip/Max Clear Time Overcurrent

The *time overcurrent* item is the standard type used to represent a single trip characteristic of a relay. Any “Function” can be used when the *time overcurrent* item is set.

The “Fuse” item allows define together a *Min melt* and a *Max clear* TCC to model the fuse characteristic. Only the *Linear approximation*, *Hermite Polynom Function* can be used when the “Fuse” item is set. The *Values* matrix will display a *Min Melt (in s)* and a *Total Clear (in s)* column.

The *Damage* item allows defining the a TCC representing the damage characteristic of a motor, a transformer, a cable etc. . . Only the *Linear approximation*, *Hermite Polynom Function* can be used when the *Damage* item is set.

The *Min trip/Max clear Time overcurrent Usage* allows defining a protective device double characteristic: it can be used to model Low Voltage breaker or any other protective device which can be modelled with a characteristic representing the minimum time spent by the device to detect the fault and a characteristic representing the maximum time spent by the device to remove the fault conditions. Please notice that when the *Min trip/Max clear Time overcurrent* item is selected only the *Linear approximation*, *Hermite Polynom* and the *DSL equation* must be used. The format for the *DSL equation* must be

$\max (<\text{max clear equation}> * \text{maxclear}, \text{min trip equation}>)$

where:

$<\text{max clear equation}>$ is the DSL equation representing the maximum time spent by the device to remove the fault conditions

$<\text{min trip equation}>$ is the DSL equation representing the minimum time spent by the device to detect the fault

The DSL interpreter will set the *maxclear* variable equal to 1 when the *max clear* characteristic points will be calculated and equal to -1 when the *min trip* characteristic points will be calculated.

4 TypChatoc input parameters definition

Table 4.1: Parameter Definitions

Parameter	Description	Unit
loc_name	Name assigned by the user to the block type	Text
i_use	Characteristic usage (Time Overcurrent, Fuse, Damage Curve, Min Trip/Max Clear Time Overcurrent)	Integer
i_type	The type of function used to define the characteristic (Definite time , IEC 255-3 equation, ANSI/IEEE, Linear approximation etc, Hermite Polynom etc)	Integer
rTp	Time dial range	Text
rResetT	The reset delay range	Text
udeftmin	The user defined TCC minimum time range	Text
udeftmax	The user defined TCC maximum time range	Text
imin	Drawn characteristic minimum current value	Float
imax	Drawn characteristic maximum current value	Float
tmin	Drawn characteristic minimum time value	Float
i_multx	"Use the same current values" flag.	Integer
i_curves	Number of curves	Integer
i_drawt	"Draw start time offset" flag	Integer
vmat	The double precision point matrix storing the values defining a characteristic by points or the function parameter values	Matrix
expression	The DSL equation string	Text
